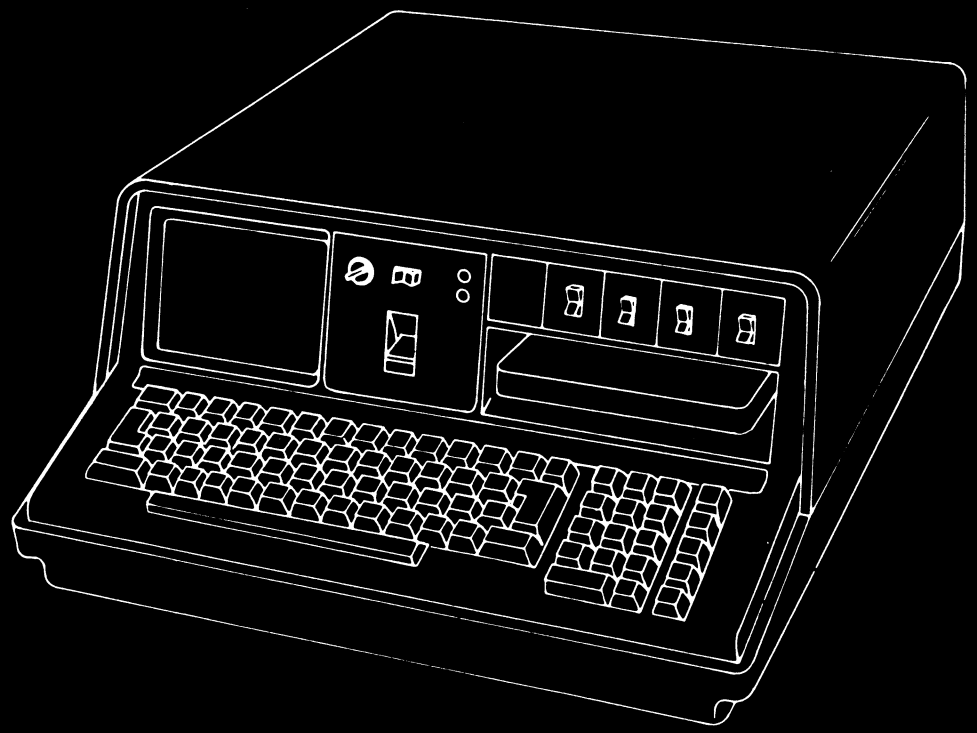
Maintenance Information Manual

5110



IBM 5110
Language Support
Maintenance Information Manual

SY31-0581-0

Preface

This manual is intended to be used by IBM 5110 service personnel who have problem determination as part of their maintenance responsibility. Service personnel are assumed to have completed the 5110 training course, and to have knowledge of the BASIC language and some familiarity with APL. This manual reviews some diagnostic techniques for locating errors in user's code and contains procedures for reporting problems.

First Edition (January 1978)

Changes are continually made to the information herein; any such changes will be reported in subsequent revisions or technical newsletters.

Requests for copies of IBM publications should be made to your IBM representative or the IBM branch office serving your locality.

A Reader's Comment Form is at the back of this publication. If the form has been removed, address your comments to IBM Corporation, Publications, Department 245, Rochester, Minnesota 55901. Comments become the property of IBM.

Contents

Manual Organization

The first section of this manual presents a review of the language diagnostic tools that are most frequently needed in locating problems in a user's program or user-defined function. The information contained in this section is extracted and condensed from the *IBM 5110 BASIC Reference Manual* and the *IBM 5110 APL Reference Manual* and is not intended to replace any part of either of these manuals.

The second and third sections describe IMF procedures and the use of the microcode trouble report form.

The fourth section of this manual offers hints about recovering data from tape and diskette when normal operation results in media error messages.

The appendix contains charts of the graphics for the IBM 5110 and code translation tables for the character codes used in the IBM 5110.

If the user's program (BASIC) or the user-defined function (APL) fails to yield the expected results, and the system diagnostics run correctly, suspect a logic error in the user's statements. Have the user demonstrate the failure and explain the expected result to you. If an error message is displayed, consult the appropriate language reference manual, *IBM 5110 BASIC Reference Manual* or *IBM 5110 APL Reference Manual*. If the program or function stops, hangs in a loop, or produces incorrect output, you will need to use some of the diagnostic tools that are reviewed in the following charts.

The charts are organized in task/action and question/answer format. When a task or a question applies to both APL and BASIC, actions for both APL and BASIC are specified. When appropriate, examples are provided for quick reference. In examples that require the name of an APL user-defined function, HOWTO has been used as the function name. Replace HOWTO with the name of the customer's user-defined function.

BASIC AND APL

Clear read/write storage.

BASIC	APL
Enter LOAD 0	Enter)CLEAR
and press EXECUTE.	and press EXECUTE
Only IMFs and feature programs remain in read/write storage.	Only IMFs and feature programs remain in read/write storage.

Load stored programs or user-defined functions and/or variables into read/write storage.

BASIC	APL
Use the LOAD command.	Use the)LOAD command.

Copy stored programs or user-defined functions and/or variables into read/write storage.

BASIC

Use the MERGE command. This command merges by statement number. The program loaded with the MERGE command will not overlay a program that already exists in read/write storage unless the statement numbers already in read/write storage are the same as the resultant statement numbers being merged.

APL

Use the)COPY command or the)PCOPY command. The)PCOPY command will not overlay a function or a variable of the same name that already exists in the active workspace.

Write the contents of read/write storage on tape or diskette.

BASIC

Use the SAVE command.

APL

Use the)SAVE command or the)CONTINUE command. You can continue, but cannot save, an active workspace that contains a suspended function.

Print a listing of the user's program or user-defined function.

BASIC

Enter `LIST PRINT`

and press EXECUTE.

To display a listing, omit the print parameter.

APL

Enter `∇HOWTO[⎕]∇`

and press EXECUTE.

If nothing prints, although the listing is displayed, enter `)OUTSEL ALL`

and press EXECUTE. Then reenter the above.

Turn on program trace or function trace.

BASIC

Enter `RUN TRACE,PRINT`

and press EXECUTE,

or

enter `GO TRACE`

and press EXECUTE.

APL

To activate trace for steps 4, 5, 6, and 7,

enter `TΔHOWTO←4 5 6 7`

and press EXECUTE.

To trace all of the steps that are executed in the first seven steps,

enter `TΔHOWTO←\7`

and press EXECUTE. Then enter the function name and arguments (if required), and press EXECUTE to start execution of the function.

Stop program trace or function trace.

BASIC

Enter `GO RUN`

and press EXECUTE,

or

enter `GO STEP`

and press EXECUTE.

APL

Enter `TΔHOWTO←\0`

and press EXECUTE.

Suspend execution of a program or a function.

BASIC

To stop after statement 0030 and before statement 0040,

enter `0035 PAUSE`

and press EXECUTE.

To stop after executing each statement,

enter `RUN STEP`

and press EXECUTE.

or

enter `GO STEP`

and press EXECUTE.

To stop anywhere in the program,

press ATTN.

APL

To stop before statement 3 and before statement 5, use stop control.

Enter `SΔHOWTO←3 5`

and press EXECUTE.

To stop anywhere within an executing function,

press ATTN.

If the cursor is at the leftmost position of line 1 of the display screen, or is on a line that already contains text, the system is probably asking for alphabetic input (quad quote input). Escape by entering the out character (⍬).

If the cursor is on a line following a quad colon (⍞:), the system is asking for numeric input. Escape by entering a right arrow (→).

If the system is in shared variable display mode, the cursor can be positioned anywhere on the screen. To escape from this condition, press EXECUTE and then press ATTN.

Leaving a program or function suspended can make a tape output file or a diskette output file unusable.

Resume execution of a suspended program or a suspended function.

BASIC

Press EXECUTE

or

enter GO

and press EXECUTE.

or

enter GO 0060

and press EXECUTE.

APL

Enter →⎕LC

and press EXECUTE.

To resume function execution with statement 13,

enter →13

and press EXECUTE.

End controlled program suspension or function stop control.

BASIC

If the program suspension is due to a PAUSE statement, delete the PAUSE statement. If the program suspension is due to the program executing in step mode,

enter GO RUN

and press EXECUTE,

or

enter GO TRACE

and press EXECUTE.

APL

Enter SΔHOWTO←⍳0

and press EXECUTE.

Replace a statement in a program or a function.

BASIC

To replace statement 0040 with a statement that assigns the value 653 to Z,

enter 0040 LET Z=653

and press EXECUTE.

APL

To replace statement 4 with a statement that assigns the value 653 to Z,

enter ∇HOWTO[4]Z←653∇

and press EXECUTE.

Insert a statement in a program or a function.

BASIC

To insert a statement between step 0060 and step 0070,

enter `0065`

followed by the new statement, and press EXECUTE.

APL

To insert a statement between step 6 and step 7,

enter `∇HOWTO[6.1]`

followed by the new statement.

Then enter `∇`

and press EXECUTE.

Renumbering of statements is automatic. Any branch to a line number that follows the inserted statement should be corrected. Always branch to a label.

Delete a statement from a program or a function.

BASIC

To delete statement 0045,

enter `0045 DEL`

and press EXECUTE.

To delete all statements from 0045 through 0090,

enter `0045 DEL 0090`

and press EXECUTE.

APL

To delete statement 4,

enter `∇HOWTO[4]∇`

and press EXECUTE.

The system then displays statement 4. Verify that the displayed statement is the one to be deleted.

Press ATTN.

Then press EXECUTE.

Then enter `∇`

and press EXECUTE to close the function.

Because renumbering is automatic, display the statement to be deleted to be sure it is the right one. Avoid branches to a line number. Branch to a label rather than to a line number.

Display intermediate results of a complex operation.

BASIC

Insert PAUSE statements. While program execution is suspended, you can display the variables by entering the variable names and pressing EXECUTE.

or

Insert PRINT statements to display the variables.

or

Break a complex statement into several shorter statements. Choose any variable names that you introduce carefully to avoid changing the value of an existing variable. Also, be aware of the hierarchy of BASIC arithmetic operators.

APL

Suspend the user-defined function between successive lines in the complex operation. While execution of the function is suspended, you can display the variables by entering the variable names and pressing EXECUTE.

or

If the complex operation is specified in a single statement, break the operation into shorter statements. Insert the shorter statements following the original statement, and then delete the

or

Replace the complex statement with []← embedded in the statement to display the results you need. The results are displayed in the order of execution. The values displayed are the results of the operations to the right of the []← characters.

```
      155+[]←([]←40÷8)×[]←3+4
7
5
35
190
```

What is the hierarchy or order of execution of operators?

BASIC

Arithmetic expressions are evaluated according to the hierarchy of the operators involved. Operations enclosed in parentheses are performed first. Operations with a higher priority level are performed before those with a lower priority level. Operations at the same priority level are performed from left to right. The hierarchy of the operators is:

	Operator	Hierarchy
1.	Enclosed in parentheses	Highest
2.	↑ or **	
3.	Positive (+) and negative (-)	
4.	* and /	
5.	Addition (+) and subtraction (-)	Lowest

APL

APL expressions are evaluated from right to left until a right parentheses is encountered. The expression enclosed in parentheses is then evaluated from right to left.

APL ONLY

Erase global objects (user-defined functions or variables) from active workspace.

Use the)ERASE command.

Replace the active workspace with a stored workspace.

Use the)LOAD command.

Change the number of symbols allowed in the active workspace.

Use the)SYMBOLS command. See the *APL Reference Manual* for the required procedure.

Change the active workspace ID.

Use the)WSID command.

Display the names of the user-defined functions in active workspace.

Enter)FNS and press EXECUTE.

Display the names of global variables in active workspace.

Enter)VARS and press EXECUTE.

Display the state indicator.

Enter)SI and press EXECUTE. The display lists the suspended and pendent functions in reverse order of occurrence (last, first). The line number of the last statement executed in a pendent function is displayed, and the line numbers of the next statement to be executed in a suspended function is displayed. An asterisk flags suspended functions.

Display the state indicator and the names of the local variables in each suspended or pendent function.

Enter)SINL and press EXECUTE. Except for the addition of the names of local objects (functions, variables, and labels), this display is identical to that in response to the)SI command.

Display the number of symbols allowed in active workspace and the number of symbols currently in use.

Enter)SYMBOLS and press EXECUTE.

Display the number of unused bytes in active workspace.

Enter ⎕WA and press EXECUTE.

Display the number of the next statement to be executed in a suspended function.

Enter ⎕LC and press EXECUTE.

Expunge (erase) a user-defined function or a global variable.

Enter ⎕EX 'name' and press EXECUTE. (If a suspended or pendent function in the active workspace has a local object with the same name as the global variable, the global variable cannot be accessed or expunged. An attempt to expunge the global object, or to assign a new value to the global variable, results in action on the local variable in the previously suspended function.)

Load a continued file into active workspace (written with a)CONTINUE command).

Use the)RESUME command if you want to have the same I/O active as when the workspace was continued. Otherwise, use)LOAD.

Verify that a name is available for use as a global variable name.

List the function that is to contain the name to ensure that the name is not specified in the function header as a local variable. Then enter ⎕NC NAME and press EXECUTE. If the result 0 is displayed, enter)VARS NAME. If the first name in the resulting display response is not the name entered, then enter)FNS NAME. If the first name returned in the resulting display is again not the name entered, the name is available for use as a global name.

An IMF (internal machine fix) provides a solution to a specific code problem in read-only storage (ROS) including executable ROS. If a system application fails and an MTR (microcode trouble report) is submitted, plant personnel analyze the problem, and if required, an IMF is generated and distributed.

IMFs, if any, are contained in a separate IMF tape cartridge or diskette, which is supplied to the customer as IMFs are developed. Before it can be used, an IMF must be loaded into read/write storage. You can load IMFs by using the loader program, which is contained in file 1 of the customer support tape or diskette.

LOADER PROGRAM

The loader program allows you to add new IMFs to an IMF tape or diskette, to load a needed IMF into the system and then return to APL or BASIC, or to copy the IMFs to another tape or diskette. Another option allows you to display the EC level of the ROS modules in the system. (The EC levels of executable ROS are not displayed.) Use the LINK command (BASIC) or the)LINK command (APL) to load the loader program.

To load the loader program:

Insert the customer support tape or diskette into tape drive 1 or diskette drive 1.

Enter one of the following:

`)LINK 1001`	for tape and APL
`)LINK 11001`	for diskette and APL
`LINK 1,E80`	for tape and BASIC
`LINK 1,D80`	for diskette and BASIC

Then press EXECUTE.

After the loader program is loaded, the following prompt is displayed:

```
LOADER FUNCTION

OPTIONS:

     1. LOAD FROM TAPE
     2. LOAD FROM DISKETTE

ENTER OPTION NUMBER AND PRESS EXECUTE
```

Enter 1 if you loaded from tape, or enter 2 if you loaded from diskette. Leave the IBM-supplied customer support media inserted and press EXECUTE.

The next message is a prompt for drive number and for file number. Respond to this prompt with 1 for drive number and with 11 for file number. (File 11 of the IBM-supplied customer support tape or diskette is the IMF file. The file name is IMF.)

If another tape or diskette containing IMFs is to be used, insert that media and respond to the loader program prompts accordingly.

The loader program checks for file type 19 (decimal) and then displays the IMF option list below:

```
ENTER OPTION NO.
1. DISPLAY EC'S
2. COPY IMF'S
3. LOAD IMF'S
4. KEY ENTER IMF
5. END OF JOB
```

LOAD IMFS

If you want to load IMFs, select option 3. The system prompts for the IMF file number with one of the following messages displayed:

```
ENTER FILE NUMBER        or     ENTER FILE NAME OR NUMBER
     (tape)                            (diskette)
```

Enter the file number and press EXECUTE. Depending on the system (APL or BASIC), one of the following options lists is displayed:

```
ALL IMF'S ARE CLEARED                  ALL IMF'S ARE CLEARED
LOAD IS FOR THIS SYSTEM                LOAD IS FOR THIS SYSTEM
ENTER LOAD OPTION NUMBER       or      ENTER LOAD OPTION NUMBER
1. LOAD ALL BASIC IMF'S                1. LOAD ALL APL IMF'S
2. LOAD IMF'S BY PROB #                2. LOAD IMF'S BY PROB #
3. DISPLAY IMF PROBID'S                3. DISPLAY IMF PROBID'S
```

When you select option 3, the next display is in the format shown below (if there are any problem IDs).

```
PROBID  PROBID  PROBID  PROBID  PROBID  PROBID  PROBID  PROBID
0001

PRESS EXECUTE TO CONTINUE
```

When you press EXECUTE, the system returns the previous option list to the display. If you choose to load IMFs by problem number (option 2), you are prompted for the four-digit problem number as shown below.

```
ENTER 4-DIGIT PROB # OR ENTER 0000 TO STOP
```

If you attempt to load an IMF that does not apply to the system, the following message is displayed.

```
LOAD ERROR 482
```

After you have loaded the IMFs that you need, enter 0000 in response to the prompt. The system then returns the following display:

```
ENTER 0 TO STOP OR 1 TO LOAD ANOTHER FEATURE
```

Enter 0, and the system returns to BASIC or APL, ready for use.

COPY IMFS

There are five ways you can copy IMFs to a tape or diskette. Select option 2 when the initial option list is displayed. The program responds with the following display.

ENTER FILE NUMBER (tape)	or	ENTER FILE NAME OR NUMBER (diskette)

Enter the IMF file number to be copied and press EXECUTE. The system next prompts for the new file ID and number as shown below:

```
ID OF IMF OUTPUT FILE
```

Respond to the prompt. The next display is the copy option table shown below:

```
ENTER SELECTED COPY OPTION NUMBER
1. COPY ALL IMF'S FOR XXXXX
2. COPY ALL XXXXX IMF'S FOR THIS SYSTEM
3. COPY IMF'S BY PROBLEM NUMBER
4. COPY XXXXX IMF'S BY PROB # FOR SYSTEM
5. COPY ALL APL,BASIC IMF'S FOR SYSTEM
```

Note: If the system is APL, XXXXX is replaced by APL. Likewise, if the system is BASIC, XXXXX is replaced by BASIC.

Choose the option you need and follow the prompting messages.

KEY-ENTER IMF

By choosing option 4 in the initial display, you are allowed to enter an IMF with the keyboard. The system prompts for the IMF file number as shown:

```
ENTER FILE NUMBER      or      ENTER FILE NAME OR NUMBER
    (tape)                            (diskette)
```

Enter the IMF file number and press EXECUTE. The system returns the following instructions:

```
ENTER IMF. EACH LINE EXCEPT THE LAST MUST BE FULL.
PRESS EXECUTE AT THE END OF EACH LINE.
```

When you have finished entering the IMF, it is written to tape or diskette. The IMF can then be loaded into the system.

DISPLAY ECS

You can display the EC level of the ROS modules in the system by using the loader program on the customer support tape or diskette. Follow this procedure:

1. Load the loader program. (Follow the instruction in *Loader Program* in this section.)

2. Select option 1 in the IMF option list that displays.

The following illustration shows the format of the resulting display:

```
MOD EC   MOD EC   MOD EC   MOD EC   MOD EC   MOD EC   MOD EC   MOD EC
10  00   12  00   12  00   13  00   14  00   15  00   16  00   17  00
18  00   19  00   1A  00   1B  00   2F  A6   10  0A   F6  AA   1A  2A
B4  C3   D9  82   3F  A2   E1  E2   10  00   11  00   12  00   13  00
14  00   15  00   16  00   17  00   18  00   19  00   1A  00   1B  00
40  00   41  00
```

If you want a printed copy of the module EC levels, use the COPY DISPLAY function.

END OF JOB

When you select option 5, end of job, the program returns the system to the loader, and the following prompt is displayed:

```
ENTER 0 TO STOP OR 1 TO LOAD ANOTHER FEATURE
```

Enter 0, and the system returns to BASIC or APL, ready for use.

This page intentionally left blank.

The microcode trouble report (MTR), form number Z150-0038, provides a uniform notification procedure for reporting problems encountered in IBM microcode functions. The MTR form should be submitted to report:

- System errors when no cause can be found
- Incorrect results from verified correct procedures, for which there is no explanation or circumvention
- Incorrect results from verified correct procedures, for which there is circumvention

THE MTR FORM

The following is a copy of the MTR form and an explanation of the information required in the report.

Item	Description	Explanation
Ⓐ	Customer name	Enter the full customer name.
Ⓑ	Customer number	This number can be obtained from the territory maintenance analysis (TMA) report or from the sales office orders and movements group.
Ⓒ	Customer mailing address	Use the complete customer mailing address.
Ⓓ	Name and mailing address	Enter the name (not the title) of the person responsible for handling MTR correspondence. Print the address of the branch office where MTR correspondence can be directed. This address is used for any follow-up required to resolve this MTR.
Ⓔ	Location number	Enter the branch office and region number.
Ⓕ	World Trade countries	World Trade country name and country number.
Ⓖ	ITPS	Enter the ITPS (internal teleprocessing system) code for the responsible branch office. This code is listed in the branch office field directory telephone listing.
Ⓗ	Phone number	Branch office phone number or the MTR originator phone number.
Ⓙ	MTR submitted	Enter month/day/year.
Ⓚ	Severity	Four levels (1 through 4) of severity codes are used to reflect the customer engineer's appraisal of the customer's problem. The severity code is used to determine the priority in processing.
	Code 1	Code 1 indicates that the customer is unable to use the microcode or that the problem results in a critical impact on his operations. In either case, an *immediate solution is required.*

Item	Description	Explanation
	Code 2	The user is able to use the microcode, but the operation is severely restricted.
	Code 3	The user is able to use the microcode with a limited function that is not critical to the overall operation.
	Code 4	A circumvention has been found. the MTR is evaluated, and action is taken as dictated by the problem. *Note:* If this block is left blank, severity code 3 is assigned.
Ⓛ	Type of application	Enter the application type: APL BASIC Include the feature name if applicable.
Ⓜ	System type and configur-ation	CPU: Enter 5110. Controller Storage Size: Enter 5110 read/write storage size. Leave remaining boxes blank.
Ⓝ	Microcode in error	Not applicable.
Ⓟ	Materials submitted with the MTR	Materials listed on the MTR that are applicable to the 5110 and any other materials and information that the customer engineer believes will be helpful in the resolution of the problem should be submitted. (See *Collecting Information to Support the MTR.*)
Ⓠ	Special activities	This block is left blank unless special instructions are available for its use.
Ⓡ	Symptom code	AI
Ⓢ	Failure keyword	APL BASIC Feature name
Ⓣ	Abstract	Up to 66 characters and spaces to describe the problem.

Item	Description	Explanation
Ⓥ	Error description text	The problem description should contain three major items: • Conditions required to produce the problem • External logic leading to the failure • Identification of any bypass, circumvention, or relief given *Note:* If additional space is required, use additional MTR forms. Indicate the original customer number and page number on the additional forms. Attach the additional forms to the original form.
Ⓦ	Submitter's name and signature	The person submitting the MTR should print his name above or below his signature.

COLLECTING INFORMATION TO SUPPORT THE MTR

When you submit an MTR, collect as much information about the problem and about the system as possible. A trouble that requires an MTR is usually repeatable, but the problem might require identical conditions.

When you submit an MTR, always send the following information in addition to the information required in the form:

- A dump of lower read/write storage
- A copy of the ROS module EC levels
- A list containing the total system configuration at the time of the trouble
- A tape or diskette copy of the remainder of read/write storage contents at the time of the trouble

With the customer's permission, send a copy of the customer's user-defined function or program. If the trouble is data sensitive, also send a copy of the failing data. Include with the customer's property (the copy of the program or function and data) instructions for the system setup, if appropriate. Also include a description of the intended use or purpose of the failing program or function.

DUMPING LOWER READ/WRITE STORAGE

The first 512 bytes of read/write storage can be dumped only if a printer is available. Do the following:

1. Prepare the printer.

2. Press and hold CMD and press HOLD.

3. Press and hold CMD and press the divide key (/ ÷ on the numeric pad).

The data from the dump reflects the contents of storage at the time of the failure in the event of a system error. (Level 3 registers were used and changed because the keyboard was used to initiate the dump procedure.)

Use the DCP I/O routine to copy the remainder of read/write storage contents. Use hex 0600 for the starting address. Display the contents of hex 00AA for the ending address. See the *IBM 5110 Computer Maintenance Information Manual* for instructions for using the DCP I/O routine.

Several data recovery routines are available to the user in the utilities tape or diskette. See the *IBM 5110 Customer Support Functions Reference Manual* for instructions on the use of these routines. In addition, there are several techniques that you can use to recover information stored on tape or diskette.

If a tape or diskette file is a record-oriented file, and an individual record or a group of records is defective, you can recover the records preceding and following the defective area by referencing them with a READ FILE statement (BASIC). Use the REC= clause to access the records that are not defective.

If the header of a tape file is defective, manually advance the tape beyond the end of the defective file. Files physically beyond the defective file can now be accessed.

If you can determine the format of a bad record in an APL record-oriented diskette file, you can recover the remaining records and create a new file, reserving space for the defective record and maintaining the same record numbers and sequence. Manually offer three shared variables, two for input (such as CTLI and DATI) and one for output (CTLO). Open the input file by assigning INR to CTLI. Open the output file using OUTF. Read the first record by assigning 0,0,1 to CTLI. If the return code is 00, signifying a good read, assign DATI to CTLO to write the record to the new file. Then read the second record by assigning 0,1,1 to CTLI. Check the return code, and, if the read is good, write the record to the new file as before. Continue reading, incrementing the record number, until the bad record is found. Enter a dummy record, and assign the dummy record to CTLO to write the dummy record. Note the defective record number so that the user can update the defective record (dummy record) when the information is available.

This page intentionally left blank.

Appendix A. Graphics and Code Translation Tables

The tables that follow are useful when you display data from tape or diskette. The contents of tape and diskette files can be displayed if you use the DCP I/O routine (read the file to read/write storage) and the diagnostic display function. Tape is normally written in ALC. Diskette data is usually in EBCDIC. However, in nontranslate mode, diskette can be written in Z-code. Both tape and diskette can be written in APL internal representation.

DOMESTIC GRAPHICS TABLE

This chart contains the graphic characters that can be printed and displayed. The characters are arranged in EBCDIC order, with rows keyed to the first hexadecimal digit, and with columns keyed to the second hexadecimal digit of a halfword. The first four rows and hex FF contain unprintable characters that can be displayed.

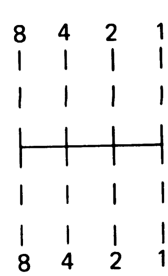
The displayed, but unprintable characters can easily be translated into EBCDIC. The bit values are as shown in the illustration to the right. Marks above the midline represent the first hexadecimal digit, and marks below the midline represent the second hexadecimal digit.



WORLD TRADE GRAPHICS TABLE

Only the characters that differ from domestic characters are contained in this chart.
